

1. How your Project will Benefit from React

I expect that I will be able to use react to change my portfolio into a single page app.

2. What the MVP of your Project will Look Like

I think it needs to be able to load sound files from the user's local hard drive and allow them to record sounds to be used in the app. Extra features would be to have a sound library available.

3. Expected List of React Components in the MVP

I will need the react component for a mic - ReactMic from 'react-mic' and npm install react-mic,

- I will also need vanilla react to wrap around HTML5 tags for the sound player like this:
- import React from 'react'
- ```
const SoundPlayer = () => { return (<audio controls> <source src="<sound file url here>" type="audio/mpeg" /> </audio>) } export default SoundPlayer
```
